Heres our comprehensive buying guide Now the iPod touch has full access to the internet, can play movies, and even make video calls using FaceTime. A new iPod touch was launched in May 2019 and is the only iPod that Apple sells. Its a great option if you want to be able to enjoy music, gaming, watch TV and movies, and more. But its still quite expensive compared to the old iPods Apple used to sell once upon a time you could buy an iPad shuffle for 39. Apple has discontinued all but the iPod touch, so if you would prefer one of the smaller, cheaper options getting your hands on one wont be as easy as it used to be, but it isnt impossible. We would generally say that the iPhone or iPad offer a good alternative to the iPod touch. Even if you are thinking of buying the device for someone who wont have a SIM card you can still use an iPhone without a SIM. It offers far more than just a simple music player, coming equipped with essentially all the features of a fully fledged iPhone bar the cellular call capabilities, and it costs less.Before we go into any more detail, its worth noting that Apple has discontinued the iPod Shuffle, nano and Classic, so youll only be able to purchase those from thirdparty retailers. Its been discontinued by Apple, but you may be able to find one on Amazon or eBay. It cost around 3950 back in the day, so you shouldnt pay much more than that unless youre desperate. Again, Apple has stopped selling this model but there are options on Amazon and eBay. This used to be available new for around 140 so dont go too much higher than that if possible. Its a little harder to find but you should be able to find one online take a look on Amazon here, on eBay here and on Gumtree here.

You might be surprised at how high their price tags are though which means if youve got a classic to sell you could fetch a decent sum of money for the old iPod. But even if it wasnt it would still be our top choice for a number of reasons. As the only iPod to run a full version of iOS, the iPod Touch has access to the full App Store, with all the games, productivity tools, social media, and camera apps that youd expect to find on an iPhone. It now has the A10 processor the same as the iPhone 7, can run AR apps and works with Apple Arcade. Its 4in display makes it the smallest screen on an iOS device that Apple still sells. The built in camera, while not quite up to the iPhone quality, still offers great shots that will go well on Instagram or Facebook both of which are also available. It also has a headphone jack and comes with a set of EarPods, obviously. Like the touch, it is also a capable device, but small enough to carry anywhere. If you want a small iPod to pop into your pocket at the

gym, and you are happy to look at second hand models, this may well be the one for you. However, even when Apple was still selling the nano it wasn't cheap, it cost 159 for 16GB. This enabled the iPod nano to have a range of included apps that broaden its appeal. Music is, of course, still the primary function, with the cool ability to create Genius mixes on the fly by tapping a button while a song is playing; the device will then automatically generate a playlist from your library based around that track. It's admittedly not the biggest display for Hollywood blockbusters, but for quick fixes on the go, or to entertain the little ones, it does the job. If you are a Nike Fitness user then you'll find the bespoke app on the iPod nano a handy addition, as the device doubles as a fitness tracker that can sync up to your NikePlus account with details of your workouts. Unfortunately it won't work with Apple Music. Its only failing was the lack of storage space, maxing out at 2GB.

Just not enough for most music libraries. It also lacked a screen so choosing music wasn't a simple process. But you could probably pick one up for next to nothing on eBay these days. The lack of a screen has meant that in the past you had to remember what was on the device, and switching between tracks was something of a lottery. It was a simple addition, but it really did make the Shuffle a far more capable device than past iterations. For that reason we would suggest that if you were looking to pick up a secondhand Shuffle you should make sure that it is a 4th generation model. It's all well and good buying the latest and greatest gadget, but this will be a waste of money if you only intend to use a fraction of its capabilities. If all you want is some musical accompaniment while you work out at the gym, the iPod touch is probably overkill although now that it includes the M8 chip for fitness monitoring it might be exactly what you are looking for. It's worth bearing in mind that this means the shuffle can hold around 450 songs encoded at 128kbps, with the nanos 16GB topping out at around the 4,000 mark. You might think that the iPod shuffle would win this category due to the lack of a powersapping screen, its diminutive size though means that it lasts for only 15 hours. This loses out to the nano which goes for around 30 hours, and the iPod touch which houses the largest battery in the range holding out for a massive 40 hours of listening time. This is an 8MP camera similar to that inside the iPhone. You'll get the same camera features such as slowmo video and burst mode shooting you won't get time lapse though. As cameras go it's a good option, allowing you to edit pictures and share them to Facebook or similar as long as you have access to WiFi. And because you can download any apps from the App Store you can make use of any photography apps you like. The iPod touch can also record video.

The iPod touch, on the other hand, can stream from the iTunes Store or play video via any app you have. The shuffle can store 450 songs encoded at 128kbps. Inevitably there will be some crossover between devices, but we feel that each is distinct enough to occupy its own place on the menu. With that in mind here are a few final conclusions regarding who might benefit most from the various iPods available. Those with smaller music libraries will also see the value of an inexpensive device that is still powerful thanks to the Voice Over feature, and of course people who don't want to spend a lot on a music player. Those who generally want a svelte device with more capacity than a Shuffle will also find the little iPod a very attractive option, and if you do already use the NikePlus fitness service, then the integrated app might well prove a tipping point. In many ways it strays a bit too close to the smartphone world to make it an actually compelling device for those who already own an iPhone. If you do want an internet capable, iOS device but find iPads a bit on the large size, then the iPod Touch will give you a good percentage of that experience, including a Retina screen, for a bit less than the iPad Mini 2. And the newest models bring a better camera and faster processor. This is also the only iPod that will let you make use of your subscription to Apple Music. Previously, people would buy an iPod because of its massive storage capabilities. With music libraries ever increasing in size, we find 216GB a little insufficient for music storage. Considering around 1,000 songs takes around 8GB, people with multiple different albums will find that a Shuffle and nano doesn't provide them with enough storage space. An iPhone might be a worthy alternative, but they are more expensive still.

We understand this isn't the best of solutions for those who like the iOS platform, but considering the price and actual use of the iPods, it makes a lot more sense to have a player that's cheaper, offers more functionality and most importantly has more storage capabilities for your music. However, if you're looking for a device that doesn't hold much space, such as the iPod Shuffle, then we still feel the iPod is still a good music source. We've also got free open-source repair manuals for every iPod Nano but this one, and we're working on that. To repair your iPod Nano 6th Generation, use our service manual. The iPod's case design is very similar to iPod Shuffle we took apart yesterday. Why, you ask? Presumably the headphone jack. Apple wanted to keep the device as thin as possible, and the curvature of the edges would have forced the case to be thicker for a completely flush glass panel. A thicker case was ditched in favor of the glass sticking out slightly. That's a rather boring 11 aspect ratio. Thank you Apple. All the other iPod Nanos we've taken apart have included three battery wires. That third battery wire typically ties into a thermistor, a resistor whose value changes with temperature a poor man's thermometer. Presumably the iPod Nano's battery is small enough and the charge rate is slow enough that overheating is not a concern. Any headphones will work as an antenna. Quite a hefty amount for such a small device. It seems now that the hold button is nonfunctioning. Any ideas I damaged my headphone jack wiring while removing the board.

Be careful, below the board, lies wires. While taking out board, I broke those. It's dead officially now. I understand that it involves some soldering, but surely it can still be done with a certain level of beginner's skill. You can follow our logic board assembly guide to remove the logic board and battery, and with some fairly simple soldering, you can swap the battery. It is offered in silver, graphite, blue, green, orange, pink and PRODUCT RED Special Edition and all colors are available with either 8 GB or 16 GB of flash memory, capable of supporting roughly 2000 or 4000 songs and 7000 or 14,000 photos, respectively. It does not support video playback. The earlier models can be updated to use the new software, too. The interface is easy to use once you get comfortable with the lack of a Home button you swipe to switch screens and certain GUI changes switch buttons are smaller and look slightly different from their standard iOS cousins. The nano refused to play with older versions of iTunes, expecting a minimum of iTunes 10. The firmware ships in an ipsw bundle, but internally, there's not a lot of there there. Much that is there has the look and feel of iOS, even if what's running under the hood may not be. From the popup alerts in the timer app be sure to use an external speaker or dock to hear your timer ping you when your eggs are cooked to the buttons, icons, and page controls, Apple has

deliberately modeled the UI on iOS. Internally though, the nano is far more limited. It has busted out a number of music screens, normally internal to the iPod touch's music app, into separate areas of access. Settings is an interesting creature. Although there's no video playback support on the nano at this time, it does provide photo slideshows; the internal settings property list, the bit that stores your preferences, hints that more video support may yet be on the horizon. Options for captions and alternative audio hint at possible upcoming movie and TV support. 0 0 0 0 0 0 0 Here's a full dump of the base readable file system. Be aware that shaketoshuffle is enabled by default, a feature that I normally disable on my iPod touch. Given the nano's new form factor, shaketoshuffle will probably be an important part of your interaction vocabulary. I thought the pedometer feature with its daily step goal was a nice little touch, but my favorite feature of the whole device. That's really cute stuff. Sadly, my old external iPod remote attachment perfect for pocket-based units no longer works. I got a popup complaint that the accessory was not supported. If you want to record voice memos or use an external squeeze control, you'll need to purchase iPhone-style earbuds separately.

Earbuds of some kind, iPhone or iPod standard, are a prerequisite for FM reception by the way. My nano did recognize my standard Apple composite video cable but I had a bit of trouble getting the unit to export live slideshows until I finally realized that you must be playing a slideshow not just browsing one for video out to kick in. Neat stuff there, however. I found the onscreen intuitive to use once I actually located the controls. Doubletap zooms into the picture, and two-finger interaction rotates it. It takes a single light tap to bring up the interaction overlay but from there, it is smooth sailing. A full system reboot for both Mac and nano seemed to fix my problems at least for the moment. Oh, and if you want to reboot your unit. The nano reboots in something like 3 seconds. It's amazingly fast. The iPod 6th generation nano manual is now live.
